## Winterizing your Intex Pool

---

The products of Intex are made of soft PVC material. To prevent damage to the product and accessories, store your pool or spa once the ambient temperature outside drops below 4 ° C.

- Step 1:** Remove all accessories and clean them thoroughly
- Step 2:** Make sure your product is cleaned after which you dry it with a dry cloth
- Step 3:** Allow the product to dry completely in the air and/or in the sun for at least 2 days
- Step 4:** After drying and before folding the liner, cover all welding seams with talcum powder
- Step 5:** Fold the product loosely without tight folds to avoid damage or leakage
- Step 6:** Store the product in a room with a constant room temperature

It is not recommended to leave your product outside during the winter period. An Intex cover is not a winter cover!

### Consequences of not storing the liner according to the instructions

These arise during the storage of your liner for the 2nd season.

#### **Multiple small holes**

Is caused by the growth of micro-organism due to moisture or when the liner has come into contact with freezing cold.

#### **Seams let loose**

This occurs when the weld seams of the liner are not covered with talcum powder. Or if the micro-organism affects the weld seams by not storing the liner according to the instructions.

Please refer to your **product manual** for specific instructions on how to winterize and store your Intex product.
